

Statistics Internals 2

Guidelines

All questions carry equal weight. Duration: 1.5 hours.

To score maximum marks:

For hypothesis testing questions: clearly state the null/alternate hypothesis if it is not given, precisely state the test to reject null, and indicate the distribution of the test statistic (including the distribution parameters).

For estimation questions: Write the test statistic and indicate the distribution of the test statistic (including the distribution parameters).

Questions

1. $H_0 : \mu = 200$ is to be tested against $H_1 : \mu < 200$ at the $\alpha = 0.05$ level of significance based on a random sample of size n from a normal distribution where $\sigma = 15.0$, what is the smallest value for n that will make the power equal to at least 0.75 when $\mu = 197$?
2. A commonly used IQ test is scaled to have a mean of 100 and a standard deviation of $\sigma = 15$. A school counsellor was curious about the average IQ of the students in her school and took a random sample of fifty student IQ scores. The average of these was $y = 107.9$. Find a 95% confidence interval for the student's IQ in school.
3. Suppose a random sample of size $n = 11$ is drawn from a normal distribution with $\mu = 15.0$. If S is the sample standard deviation, for what value of k is the following true?

$$\Pr \left\{ \frac{\bar{Y} - 15}{S/\sqrt{11}} \geq k \right\} = 0.05.$$

4. Let Y_1, Y_2, \dots, Y_n be a random sample of size n from the pdf $f_Y(y; \theta) = \frac{1}{\theta} e^{-y/\theta}$, $y > 0$. Let $\hat{\theta} = nY_{min}$. Prove or disprove: $\hat{\theta}$ is an unbiased estimator for θ .
5. Mutual funds are investment vehicles consisting of a portfolio of various types of investments. If such an investment is to meet annual spending needs, the owner of shares in the fund is interested in the average of the annual returns of the fund. Investors are also concerned with the volatility of the annual returns, measured by the variance or standard deviation. One common method of evaluating a mutual fund is to compare it to a benchmark, the Lipper Average being one of these. This index number is the average of returns from a universe of mutual funds. The Global Rock Fund is a typical mutual fund with heavy investments in international funds. It claimed to best the Lipper Average in

terms of volatility over the period from 1989 through 2007. Its returns are given in the table below.

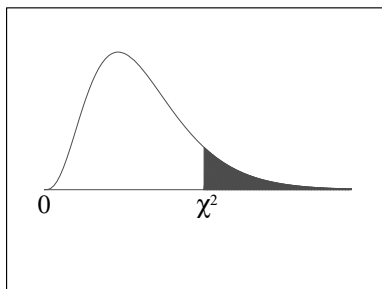

Year	Investment Return %	Year	Investment Return %
1989	15.32	1999	27.43
1990	1.62	2000	8.57
1991	28.43	2001	1.88
1992	11.91	2002	-7.96
1993	20.71	2003	35.98
1994	-2.15	2004	14.27
1995	23.29	2005	10.33
1996	15.96	2006	15.94
1997	11.12	2007	16.71
1998	0.37		

The standard deviation for these returns is 11.28%, while the corresponding figure for the Lipper Average is 11.67%. Clearly, the Global Rock Fund has a smaller standard deviation than the Lipper Average, but is this small difference due to random variation? Justify your answer. You may choose the confidence level as 95%.
